

Online Consumer Monitors status

July 27st, 2001
Commissioning Meeting

Current Status:

- 11 consumers ran routinely by CO:
(TrigMon, XMon, YMon, LumMon, ObjectMon, BeamMon, SiliMon, Stage0, L3RegionalMon, SVXMon & EventDisplay)
- SPYSVTMon being tested frequently
- Current cdfsoftb0 release: based on 3.17.0int4
- In a process of building a new cdfsoftb0 release: based on 3.18.0int3 with up to date consumer monitors and DBANA.
- Consumer Central Error Receiver is routinely running now. We have tested that error messages from a consumer (with partition 14) successfully received by the Error Receiver, which consequently sent the message to Run Control and displayed on the Run Control Error Display GUI.
We are going to turn on error messages slowly after some more tests.

- archiving the old files on CD(.root and .log) and deleting from /data1/consumer/results area.

see www-b0.fnal.gov:8000/consumer/framework/consumer_results_status.html (Linked from the consumer home page) **for details.**

Request to the detector/trigger experts:

- To make CO's to be able to find the problems as easy/quick as possible, please communicate with Consumer-code writers/CO, specific things they should look for (when something goes wrong). There is a white folder in the control room to keep the hard copy of these information for CO.

Request to the Calibration Consumer Writers:

- Please make the calibration Consumers based on a single offline releases, so that we do not have to keep many offline releases on b0dap30 disk (always short on disk space).
